

V1 EXECUTION PLAN

Finish the controlled Coin Card pilot gates, production-security dependencies, controlled issuance, placements, and genuine-payment evidence. Do not begin billing, V2 accounts, horizontal expansion, or V3 experiments early.

CURRENT PHASE

V1 · ACTIVE

Source	Roadmap Revision 6
Governing commit	ec78178
Published	July 30, 2026
Custody	Self-custodial

COMMAND

What V1 must prove

01 Trustworthy route A payer can verify the current signed route, wallet-control evidence, lifecycle state, and transaction-time record.	02 Real use Qualified recipients place controlled cards and receive genuine third-party payments—not demos or founder-created traffic.	03 Operable pilot Issuance, suspension, revocation, expiry, evidence, incidents, and support work without unsafe improvisation.
--	--	---

EXECUTION SEQUENCE

Work in this order

- Lock the governing decisions**

Ratify the signed-record stack, namespace policy, minimal V1 data boundary, custody tripwires, validity period, and reverification interval.
- Close production-security dependencies**

Resolve Gate 1A, complete the structured security review, harden administrative accounts, and establish the served-content integrity tripwire.
- Complete the controlled credential path**

Verify wallet control, sign the manifest, publish lifecycle state, fail closed when authority is unavailable, and preserve the governing route in the evidence packet.
- Prepare pilot operations**

Approve the cohort manually; rehearse issuance, support, suspension, revocation, expiry, compromise, and incident procedures; obtain counsel's screening determination before the first genuine payment.
- Run the evidence program**

Make qualified offers, place cards, observe genuine third-party payments, retain evidence, and record where the workflow helped or failed.
- Make the gate decision**

Advance only if the binding gates pass and the working thresholds justify V2. Otherwise pause, narrow, or stop according to the recorded evidence.

EXECUTION CHECKLIST

V1 gate tracker

A · GOVERNANCE DECISIONS

- ☐ Existing signed-record contracts ratified for the V1 claim.
- ☐ Handle URL and namespace-governance policy locked.
- ☐ Minimal V1 PII and retention boundary approved.
- ☐ Custody tripwires published internally.
- ☐ Credential validity and reverification interval ratified.

B · PRODUCTION SECURITY

- ☐ Gate 1A production dependency exception resolved.
- ☐ Structured security review completed.
- ☐ Registrar, DNS, GitHub, and Firebase use hardware-backed MFA where supported.
- ☐ Served-content integrity tripwire operating.
- ☐ No unresolved critical or high-severity pilot-path findings.

C · CREDENTIAL AND EVIDENCE PATH

- ☐ Production wallet-control challenge verified.
- ☐ Signed manifest issued from canonical bytes.
- ☐ Independent verifier works without mutable presentation trust.
- ☐ Active, expired, suspended, revoked, replaced, and unavailable states verified.
- ☐ Every non-current or unauthenticated state blocks payment.
- ☐ Transaction evidence preserves the governing route version.
- ☐ Hosted Coin Card route and durable card ID verified.
- ☐ Static iframe or hosted-link path verified.

D · PILOT OPERATIONS

- ☐ Initial cohort selected through manual approval.
- ☐ Issuance and reverification runbook rehearsed.
- ☐ Suspension, revocation, replacement, and compromise runbook rehearsed.
- ☐ Support and uncertain-outcome procedure rehearsed.
- ☐ Incident, rollback, and communication procedure rehearsed.
- ☐ Counsel determination on address screening recorded before the first genuine payment.

E · CUSTOMER EVIDENCE

- ☐ Up to 50 qualified direct pilot offers recorded.
- ☐ At least 10 pilot cards placed.
- ☐ At least 5 placements achieved within the first 50 qualified offers.
- ☐ At least 3 cards receive genuine third-party payments.
- ☐ Placement, payment, failure, support, and customer-response evidence retained.

F · GATE DECISION

- ☐ Every binding security, authority, evidence, and legal gate passes.
- ☐ Working thresholds reviewed as decision evidence, not statistical proof.
- ☐ Advance, pause, narrow, or stop decision recorded with supporting evidence.

SCOPE CONTROL

What belongs in V1

Included

- Manually approved, time-limited pilot entitlements
- Hosted Coin Card route with durable card ID and revocable handle
- Production wallet-control verification
- Signed manifest and independently usable verifier
- Lifecycle, revocation, supersession, and degraded unavailable state
- Static iframe or hosted link
- Polygon USDC only
- Current transfer execution, receipt, and proof packet
- Issuance, revocation, incident, and support runbooks

Excluded until a later gate

- Billing and automatic renewal
- Public self-service issuance or public Free tier
- Analytics beyond operating evidence
- Additional assets or chains
- Directory or discovery
- On-ramp or off-ramp
- Embedded wallets
- Arbitrary customization
- Automatic or recurring payment pulls

DECISION RULES

Binding gates and working thresholds

Binding gates

Failure blocks release regardless of customer interest.

- Production security and dependency closure
- Custody and authority boundary
- Signed-record and evidence integrity
- Fail-closed lifecycle behavior
- Legal and screening determination for the actual V1 flow
- No unresolved critical or high-severity finding

Working evidence thresholds

These support the next decision; they are not market validation.

- 10 controlled cards placed
- 3 genuine third-party payments
- 5 placements from no more than 50 qualified offers
- Evidence that recipients share and reuse the credential
- Evidence that the route or proof distinction matters

Stop rule. If fewer than five qualified prospects place a card after 50 direct offers, stop feature expansion and re-interview the segment. If placed cards do not receive genuine payments, investigate the actual use case before billing.

MASTER BOUNDARY

Authority ImplicitEx does not take

ImplicitEx does not receive, hold, independently direct, guarantee, insure, lend, convert, or recover customer funds.

The user controls the wallet and authorizes the transaction. Any feature that would introduce key control, balances, independent initiation, release control, conversion, yield, credit, or principal-loss reimbursement stops for written legal and architectural review.

PRINTABLE RECORD
